

**Amendments to the Claims:**

The listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A computer ~~product~~ readable storage medium having stored therein distribution map data used to distribute a map through communication, the distribution map data comprising:

road data ~~[[set]]~~ in correspondence to each of ~~specific~~ a plurality of map area blocks, wherein the road data provides ~~to provide~~ position information indicating positions of roads within the map area blocks; and

integrated name data ~~each set of which~~ that provides common name information for a road passing through ~~a plurality of the~~ map area blocks in common with the ~~plurality of~~ map area blocks.

2. (Currently Amended) A computer ~~product~~ readable storage medium according to claim 1, wherein:

the distribution map data ~~include~~ includes the road data in each of a plurality of map layers set in correspondence to different specific scaling factors; and

~~each set of~~ the integrated name data provides the common name information for ~~[[a]]~~ the road in common with the plurality of map layers as well.

3. (Currently Amended) A distribution map data generating method for generating distribution map data used to distribute a map through communication, comprising:

extracting road data and name data over ~~a plurality of~~ map area blocks to indicate a route passing through the ~~plurality of~~ map area blocks, from road map data that ~~includes road data set in correspondence to each of specific map area blocks to provide~~ provides position information indicating positions of roads in each of the map area ~~block~~ blocks and ~~name data set in correspondence to each of the map area blocks to provide~~ that provides name information indicating names in each of the roads in the map area ~~block;~~ blocks;

generating integrated name data by integrating name information for a single road in the extracted name data, ~~which is set in correspondence to a plurality of map area blocks to indicate a single road,~~ so as to provide common name information for ~~indicating name of a road~~ the single road in common with the ~~plurality of~~ map area blocks; and

generating the distribution map data by using the extracted road data and the integrated name data.

4. (Currently Amended) A distribution map data generating method according to claim 3, wherein:

the distribution map data ~~include~~ includes the road data in each of a plurality of map layers set in correspondence to different specific scaling factors; and

~~each set of~~ the integrated name data provides the common name information for ~~[[a]]~~ the single road in common with the plurality of map layers as well.

5. (Currently Amended) A distribution map data generating method according to claim 3 wherein:

the route passing through the map area blocks is determined as a road from a start point to an end point based upon the road data; and

when extracting the road data and the name data indicating the route, road data and name data contained in an area ranging over a predetermined width along the route are extracted based upon the road map data.

6. (Currently Amended) A distribution map data generating apparatus that generates distribution map data used to distribute a map through communication, comprising:

a storage device that stores road map data that ~~includes road data set in correspondence to each of specific map area blocks to provide~~ provides position information indicating positions of roads in ~~the~~ each of map area ~~block blocks~~ and ~~name data set in correspondence to each of the map area blocks to provide~~

that provides name information indicating names of the roads in each of the map area ~~block;~~blocks;

an extraction device that extracts road data and name data over a plurality of the map area blocks to indicate a route passing through the ~~plurality~~ of map area blocks based upon the road map data;

an integrating device that generates integrated name data by integrating name information ~~set~~ for a single road in the name data extracted by the extraction device ~~in correspondence to individual map area blocks to indicate a single road,~~ so as to provide common name information for ~~indicating name of~~ the single road in common with the ~~plurality of~~ map area blocks; and

a generating ~~means for generating~~ device that generates the distribution map data by using the road data extracted by the extraction ~~means~~ device and the integrated name data.

7. (Currently Amended) A distribution data generating apparatus according to claim 6, wherein:

the distribution map data ~~include~~ includes the road data in each of a plurality of map layers set in correspondence to different specific scaling factors; and

~~each set of~~ the integrated name data provides the common name information for ~~[[a]]~~ the single road in common with the plurality of map layers as well.

8. (Currently Amended) A distribution map data generating apparatus according to claim 6, wherein:

the route passing through the map area blocks is determined as a road from a start point to an end point based upon the road data; and

when extracting the road data and the name data indicating the route, the extraction ~~means~~ device extracts road data and name data contained in an area ranging over a predetermined width along the route based upon the road map data.

9. (Currently Amended) A terminal device that displays a map by using distribution map data including the road data and integrated name data to indicate a route passing through map area blocks, the integrated name data providing common name information for a single road in common with the map area blocks, generated at a distribution map data generating apparatus according to claim 6, comprising:

a reception device that receives the distribution map data transmitted from an external source; and

a display device that displays ~~at least part of a~~ the route on a monitor based upon the road data in the received distribution map data and that displays names of roads ~~attached to the roads~~ on the route based upon the integrated name data in the received distribution map data.

10. (Previously Presented) A terminal device according to claim 9, further comprising:

a first position determining device that determines display positions at which the names of the roads on the route are displayed by the display device based upon road types of the roads on the route.

11. (Currently Amended) A terminal device according to claim 9, further comprising:

a second position determining device that determines display positions at which the names of the roads on the route are displayed by the display device so as to orient the names of the roads on the route to be parallel ~~paralleled~~ to inclinations of the route.

12. (cancelled).

13. (cancelled).

14. (Currently Amended) A distribution map data generating method according to claim 4, wherein:

the route passing through the map area blocks is determined as a road from a start point to an end point based upon the road data; and

when extracting the road data and the name data indicating the route, road data and name data contained in an area ranging over a predetermined width along the route are extracted based upon the road map data.

15. (Currently Amended) A distribution map data generating apparatus according to claim 7, wherein:

the route passing through the map area blocks is determined as a road from a start point to an end point based upon the road data; and

when extracting the road data and the name data indicating the route, the extraction device extracts road data and name data contained in an area ranging over a predetermined width along the route based upon the road map data.

16. (Currently Amended) A terminal device that displays a map by using distribution map data including road data and integrated name data to indicate a route passing through map area blocks, the integrated name data providing common name information for a single road in common with the map area blocks, generated at a distribution map data generating apparatus according to claim 7, comprising:

a reception device that receives the distribution map data transmitted from an external source; and

a display device that displays ~~at least part of a~~ the route on a monitor based upon the road data in the received distribution map data and that displays

names of roads ~~attached to the roads~~ on the route based upon the integrated name data in the received distribution map data.

17. (Currently Amended) A terminal device that displays a map by using distribution map data including road data and integrated name data to indicate a route passing through map area blocks, the integrated name data providing common name information for a single road in common with the map area blocks, generated at a distribution map data generating apparatus according to claim 8, comprising:

a reception device that receives the distribution map data transmitted from an external source; and

a display device that displays ~~at least part of a~~ the route on a monitor based upon the road data in the received distribution map data and that displays names of roads ~~attached to the roads~~ on the route based upon the integrated name data in the received distribution map data.

18. (Currently Amended) A terminal device that displays a map by using distribution map data including road data and integrated name data to indicate a route passing through map area blocks, the integrated name data providing common name information for a single road in common with the map area blocks, generated at a distribution map data generating apparatus according to claim ~~[[13]]~~ 15, comprising:

a reception device that receives the distribution map data transmitted from an external source; and

a display device that displays ~~at least part of a~~ the route on a monitor based upon the road data in the received distribution map data and that displays names of roads ~~attached to the roads~~ on the route based upon the integrated name data in the received distribution map data.

19. (Currently Amended) A terminal device according to claim ~~[[14]]~~ 16, further comprising:

a first position determining device that determines display positions at which the names of the roads on the route are displayed by the display device based upon road types of the roads on the route.

20. (Currently Amended) A terminal device according to claim ~~[[15]]~~ 17, further comprising:

a first position determining device that determines display positions at which the names of the roads on the route are displayed by the display device based upon road types of the roads on the route.

21. (Currently Amended) A terminal device according to claim ~~[[16]]~~ 18, further comprising:

a first position determining device that determines display positions at which the names of the roads on the route are displayed by the display device based upon road types of the roads on the route.

22. (Currently Amended) A terminal device according to claim 10, further comprising:

a second position determining device that determines display positions at which the names of the roads on the route are displayed by the display device so as to orient the names of the roads on the route to be parallel ~~paralleled~~ to inclinations of the route.
